R.Pleau, J.M.; Daddenne, M.: Blouquit, Y.; Bach, J.F.
J. Biol. Chem. 252, 8045-8047, 1977
A.7Title: Structural study of circulating thymic factor: a peptide isolated from pig starcession: A01523
A.Molecule type: protein
A.Molecule type: protein
A.Molecule type: protein
A.Molecule type: Dradenne, M.; Pleau, J.M.; Rosa, J.
Nature 266, 55-57, 1977
A.7Title: Biochemical characterisation of a serum thymic factor.
A.Reference number: A60983; MUID:77123829
A.Accession: A60983
A.Molecule type: protein
A.Residues: 2', 2-4', 2', 6-9 < CAMC>
C.Comment: This peptide induces DNA synthesis in immature thymocytes, but not periphe in a variety of immunossays.
C.Comment: See PIR:A60957 (sheep) for discussion of another possible N-terminal modif C.Superfamily: thymic factor
C.Superfamily: thymic factor
C.Keywords: pyroglutamic acid
F:1/Modified site: pyrrolidone carboxylic acid (Gln) #status experimental
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          thymocyte growth peptide - sheep

A; Accession: A01341
A; Moteoule type: protein
A; Moteoule type: protein
A; Mesidues: 1-7 < AVIX
C; Comment: The mycelia of this imperfect fungus produce the metalloenzyme galactose o apoenzyme, may inactivate the enzyme by binding to its prosthetic copper group.
C; Superfamily: galactose oxidase inhibitor
C; Keywords: copper

immunogenic T-cell peptide epitopes present in polypeptide antigens. The method involves the identification of peptide sequences capable of binding to an HLA (human leukocyte antigen) class I molecule and measuring the binding of this epitope peptide to the HLA class I peptide. The stability of binding of the peptide and MHC (major histocompatability complex) class I molecule is measured on intact human B cells carrying the MHC molecule at their cell surfaces. The method can be used to select peptide epitopes for generating vaccines against a disease associated with the polypeptide, e.g. cancers or AIDS. The peptide epitopes are especially T-cell peptide epitopes with strong anti-tumour and anti-viral immune responses. Peptide W33 is derived from the human carcino-embryonic antigen (CEA) and has the ability to bind to the human MHC class I allele HLA-A2.1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Method of selecting T cell peptide epitope(s) - by measuring the stability of HLA class I-peptide complexes on intact B cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             95.6%; Score 43; DB 18; Length 9; 88.9%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             QQ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   or antigonists (Ib) of human carcinoembryonal antigen (CEA). (Ia) are used in vaccines to kill or inhibit carcinoma cells that express CEA or its epitopes, particularly for treating gastrointestinal, breast, pancratic, bladder, ovarian, lung or prostatic carcinoma. They can also be used to proliferate T cells, e.g. from vaccinated subjects, for use in adoptive transfer therapy. (Ib) are used to inhibit CEA-specific immune responses, e.g. in vaccinated subjects, to prevent an autoimmune reaction to cancer immunotherapy (i.e. to prevent attack on normal but generate a highly specific and systemic anti-CEA response. Cytotoxic T cells generated recognize both (Ia) and native CEA expressing cells).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                present invention describes peptides (A) that comprise agonists (Ia)

molecules with antigen presenting cells (APCs) pretreated with antigen presenting cells (APCs) pretreated with antigen presenting cells (APCs) pretreated with purified CD8 cells in the presence of at least 2 incubation growth factors, thereby producing antigen-specific CTs. A method for specifically killing target cells in a human patient is also provided which comprises obtaining a fluid sample containing CTLs from a patient, contacting the cytotoxic T cells with APCs pretreated with pre-treatment growth factors, where the APCs comprise class I MHC molecules. The pretreated APCs are incubated with the cytotoxic growth factors, thereby producing activated CTLs which are contacted with a carrier to form a composition. The composition can then be administered to the patient. The activated CTLs can be used for treating cancers, immune disorders, viral infections, ALDS, hepatitis, bacterial infection, fungal infection, malaria or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Immunogenic peptide having a human leukocyte antigen binding motif #2266
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human leukocyte antigen; binding; immunogenic; glycoprotein; MHC; HLA; immune response; T cell activation; major histocompatibility complex; cytocoxic T lymphocyte; CTL; tumour rejection; viral infection; cancer; prostate cancer; hepatitis B; hepatitis C; AIDS; renal carcinoma; vaccine; immunisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Y45390 to Y48214 represent specifically claimed immunogenic peptides having a human major histocompatibility complex (MHC) Class I (also known as human leukocyte antigen (HLA)) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes
              of invention of producing antigen-specific cytotoxic T cells (CTLs) in vitro. The method comprises contacting immunogenic peptides from an antigen that binds class I major histocompatibility complex (MHC)
     leukocyte antigen (HLA), HLA-A2.1 and are used to exemplify the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New immunogenic peptides with HLA binding motif, useful in treatment and diagnosis of cancers and viral diseases
                                                                                                                                                                                                                                                                                                                                                                                         Score 43; DB 19;

                                                                                                                                                                                        depleted mutants of a native disease-specific CTL epitope. The cysteine-depleted CTL epitopes elicit a stronger or more specific CTL response than the native epitope. The epitopes can be used in a disease-specific immunogen to protect a mammal against disease in particular melanomas. The peptides may also be used to screen a sample for the presence of an antigen with the same epitope, or with a different cross-reactive
                                                                                                                                                       The peptide epitope W77119-W77138 were created for human tumour-specific cytotoxic T lymphocyte response. These peptides are are cysteine-

response against the antigen from which the peptide is derived.
Cytotoxic T lymphocytes (CTLS) which destroy antigen-bearing cells are
Cytotoxic T lymphocytes (CTLS) which destroy antigen-bearing cells are
cormally induced by an antigen in the form of a peptide fragment bound
to a HLA molecule, rather than the intact foreign antigen fiself, and
are particularly important in tunnour rejection and in fighting viral
infections. The peptides are therefore useful therapeutically to treat
or prevent viral infections and cancers in mammals (especially humans)
e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma.
They can be administered as vaccines to elicit an immune response in
individuals susceptible or otherwise at risk of viral infection or
cancer, or used to treat chronic or acute conditions. They are also
useful diagnostically, and can be used to induce a cytotoxic T cell
response, by contacting a cytotoxic T cell with the peptide e.g. to
produce CTLS ex vivo for infusion back into a patient. The

(Ia) are used in vaccines to kill or inhibit carcinoma cells that express CEA or its epitopes, particularly for treating gastroincestinal, breast, pancreatic, bladder, ovarian, lung or prostatic carcinoma. They can also be used to proliferate T cells, e.g. from vaccinated subjects, for use in adoptive transfer therapy. (Ib) are used to inhibit CEA-specific immune responses, e.g. in vaccinated subjects, to prevent an autoimmune reaction to cancer immunotherapy (i.e. to prevent attack on normal but CEA-expressing cells). (Ia) are more active than native sequence (I) and generate a highly specific and systemic anti-CEA response. Cytotoxic T cells generated recognize both (Ia) and native CEA epitopes. The present sequence represents a specifically claimed example of (Ia).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     aliele-specific binding motif for the major histocompatibility complex (MHC) molecule HLA, e.g. HLA-A2.1. The peptides have conserved residues at certain positions such as positions 2 and 9. Also, the peptides do not comprise negative binding residues at other positions, such as positions (2.1, 3, 6 and/or 7 (peptides 9 amino acids long) and at polsons 1, 3, 4, 5, 7, 8 and/or 9 (peptides 9 amino acids long). The peptides are used to comprises contacting cytotoxic T cells from a patient (optionally expressing a specific MHC class I allele) with the present peptides. The peptides are used to treat and prevent microbial infection (e.g. in the peptides are used to treat and prevent microbial infection, AIDS, cytomegalovirus (CMV), malaria, and condyloma acuminatum) and cancer (e.g. prostate cancer, renal carcinoma, cuminatum) and cancer (e.g. prostate cancer, renal carcinoma, carcinoma, 1ymphoma). Patients in the acute phase of infection can be treated with the peptides in conjunction with other treatments. The antigenic opeptides may be used to elicit cytotoxic T lymphocytes (CTLS) ex vivo and in the context of the result of the result

The present invention describes peptides (A) that comprise agonists (Ia) or antagonists (Ib) of human carcinoembryonal antigen (CEA). (Ia) are used in vaccines to kill or inhibit carcinoma cells that express CEA or its epitopes, particularly for treating gastrointestinal, breast, pancreatic, pladder, ovarian, lung or prostatic carcinoma. They can also be used to proliferate T cells, e.g. from vaccinated subjects, for use in adoptive transfer therapy. (Ib) are used to inhibit CEA-specific immune responses, e.g. in vaccinated subjects, to prevent an autoimmune ceaction to cancer immunotherapy (i.e. to prevent attack on normal but generate a highly specific and systemic anti-CEA response. Cytotoxic T cells generated recognize both (Ia) and malive CEA esponse. Cytotoxic T cells generated recognize both (Ia) and malive CEA epipopes. The present

The present invention describes peptides (A) that comprise agonists (Ia) or antagonists (Ib) of human carcinoembryonal antigen (CEA). (Ia) are used in vaccines to kill or inhibit carcinoma cells that express CEA or its epitopes, particularly for treating gastrointestinal, breast, particularly for treating gastrointestinal, breast, particularly for treating of prostatic carcinoma. They can also be used to proliferate T cells, e.g. from vaccinated subjects, for use in adoptive transfer therapy. (Ib) are used to inhibit CEA-specific immune responses, e.g. in vaccinated subjects, to prevent an autoimmune reaction to cancer immunotherapy (i.e. to prevent attack on normal but CEA-expressing cells). (Ia) are more active than native sequence (I) and generate a highly specific and systemic anti-CEA response. Cytotoxic T cells generated recognize both (ia) and native CEA epitopes. The present sequence represents a specifically claimed example of (Ia).

The CEA specific CTC can be used to determine the CTC eliciting epitope of CEA, and to screen for compounds which enhance the ability of the antigen to create a CTC response. A host with a CEA expressing tumour can be treated by introducing the CTC to the host, and at least 1 periodic interval after that introducing a CEA peptide, i.e. the present peptide.

The present peptide is positive for binding to HiA-A2, and scored spropriate peptide results in the upregulation of surface HIA-A2 on the T2 cells, which can be quantified via FACScan using an enti-HIA-A2 antibody (background 280 and 300).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Generation of human cytotoxic T-cells specific for CEA - useful in therapy, epitope mapping and drug screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Producing carcinoembryonic antigen (CEA) specific human cytotoxic

This sequence represents a V8 proteinase digestion product of an isolated pure enzyme which is capable of catalysing the conversion of DNA to CO-DNA. CO-DNA is a form of DNA in which a carbonyl group is attached to the 1' carbon of the sugar constituent of the DNA. The enzyme can be used to convert DNA to CO-DNA which reduces or eliminates the ability of a cell to divide. The enzyme can be used for inhibiting cell proliferation and for treating tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cell proliferation; tumour; lysilendopeptidase;
                                                                                                                                                                                                                                                                                                                                                                                                                                                              Fragment of enzyme capable of catalysing conversion of DNA to CO-DNA.
did not compromise the structural integrity and folding stability of the progenitor domain. The invention provides vectors that are used for the production of PH domain-like peptide libraries, which can be screened to identify peptides that have desirable properties, especially novel binding or catalytic properties, and which may be of use in research or therapy, or as vaccines. Novel synthetic protein structural templates for the generation, screening and evolution of functional molecular surfaces are provided.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            to reduce or inhibiting cell

The progenitor AB sequence comprises amino acid residues 16-21 of a stabilised synthetic PH domain (see W54310) of human cytohesin 1. The peptide library was generated by randomisation of AB and CD loop regions using randomised oligonucleotide primers (see W26493-94). The randomised AB and CD loop regions of 9 clones (see W54292-309) of the peptide library are provided. Randomisation

The sequences given in R88473-80 are internal tryptic peptides derived from trehalose-6-phosphate (Tre6P) synthase from M. samegmatis. Tre6P is the key enzyme in the synthase from M. samegmatis. Tre6P is the key enzyme in the synthesis of trehalose via Tre6P. The aim of the invention is to produce a transgenic plant with increase trehalose content. Tre6P in M. samegmatis is were derived from a protein which was purified. These peptides were derived from a protein which was purified with a mol. Wt. of 55 kD which shared antigenic determinants with the yeast Tre6P synthase protein. Using these peptides probes may be designed for the isolation of the Tre6P gene (TSP1) for the production of the transgenic plants. The trehalose may be isolated from the transgenic plants and used in bulk preparation including the preservation of the flavour and structure of food stuffs during drying. ```
The nucleotide sequence which encodes R78208, a B. thuringlensis (B.t.) endotoxin derived peptide, specifies the degenerate probe og Parobe can be used for the detection of endotoxin producing B.t. microbes. The probe aids in the search for useful microbes hosting toxin encoding genes, specifically from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 antigen; epitope; immunogenic target protein; PSA; HBVC; HBVS; EBV; HIV1; plasma specific antigen; hepatitis B virus; Epstein Barr; human immunodeficiency virus; human papilloma virus; pS3; c-ERB2; MAGE-1; melanoma antigen-1; core antigen; surface antigen; pharmaceutical composition; in vivo; ex vivo; therapeutic; diagnostic; MHC class I molecule; major histocompatability complex; HLA-A2.1; 9mer; 10mer; anchor; human leukocyte antigen; PLP; 8mer; allontthm prediction; MBP; CMV; cytomegalovirus; HSV; herpes simplex virus; influenza A; M1; LCMV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      R73685-876 are potential peptide binders of HLA-A2.1 motif. Using motifs disclosed in the invention, these peptides were screened for further motifs. Only peptides with binding affinity of at least 1%
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Antigen fragment 124, from LCMV has binding affinity for HLA-2.1.
                 Nucleotide sequence used as probes to identify Bacillus thuringiensis - are derived from the B.thuringiensis endotoxin genes, for identifying microbes which encode toxins

This peptide is an example of a peptide which binds to a human leucocyte antigen HLA-DQ4 molecule. The peptide was isolated from a phagemid combinatorial library comprising the sequence VG553, by screening with an HLA-DQ4 molecule. The peptide is used for the treatment of autoimmune disease, or especially for treatment of viral diseases.
                                                                                                                                                                                                                                                                                                     {\tt HLA-binding} oligopeptide and an immuno:regulator contg it - used in the treatment of auto:immune disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antibacterial; antiparasitic; cytostatic; pyrrolobenzodiazepine;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This peptide is an example of a peptide which binds to a human leucocyte antigen HLA-DD4 molecule. The peptide was isolated from a phagemid combinatorial library comprising the sequence V05953, by screening with an HLA-DQ4 molecule. The peptide is used for the treatment of autoimmune disease, or especially for treatment of viral diseases.
(binding affinity is expressed as an ICSO value) as compared to the standard peptide (R71293) in assays. This peptide from LCMV (sic) Np antigen has a binding value of 0.0280. The peptides of the invention can induce cytotoxic T lymphocytes which can react with target cells. They can be used for the treatment or prophlyaxis of cancer, eg.

arthritis (RA) using two-dimensional electrophoresis to generate a two-dimensional array of features. The method can be used for screening, diagnosis and prognosis of RA in a subject or for monitoring the effect of an anti-RA drug or therapy administered to a subject. The method comprises: (a) analysing a sample of serum or plasma and optionally syno-dimensional electrophoresis, to generate a two-dimensional array of features; (b) identifying at least one chosen feature whose relative abundance correlates with the presence or absence of RA; and (c) comparing the abundance of each chosen feature in the sample with the abundance of that chosen feature in serum or plasma from one or more persons without RA, where the relative abundance of the chosen feature or features in the sample indicates the presence or absence of RA in the subject. The method can also be used in clinical studies for testing drugs for therapy of RA, for purification of RA-diagnostic feature (RADF) proteins can be used to identify compounds that promote or inhibit their activity, which are then used as RA drugs. Nucleic acid encoding RADFs can be used in gene therapy represent expression reference protein isoform peptides, Y42101 to Y42103 represent expression reference protein isoform peptides and 225066 to 225068 represent degenerate probes for RPIS, which are all used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     given in Y54378. Hellomycin is a polycysteine peptide with antifungal and antibacterial activity, isolated from the lepidopteron Heliothis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ò
                                                                                                                                                                                                                                                                                                   The invention relates to novel pyrrolobenzodiazepine (PBD) derivatives which are compounds that bind to the minor groove of double stranded nucleic acid sequences, especially at the sequence Purine-Guanine-Purine where Purine is selected from adenine and guanine. The PBD's can be used in combinatorial peptide library screening for binding interactions with nucleic acids. The PBD's can be used in cytotoxic, antibiotic, antiparastitic and antiviral compositions and also in methods of diagnosis and in methods of target validation in functional genomics. The peptides Y83826-Y83833 represent PBD-peptides isolated from combinatorial peptides library screen on the target nucleic acid sequence 299178.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

The mimotopes are used in the method of the invention to obtain antibodies specifically and strongly reactive with a desired analyte. 16 of the peptides were tested for ability to bind the murine antibody Mab33-6, arbitrarily chosen, and known to bind to the peptides MB4. 3 of the 16 peptides successfully bound Mab33-6. The mimotope is obtd. by reacting a panel of starting antibodies (Abs) representative of the resting B cell repertoire of a mammmal with an analyte (so as to identify analyte-reacting Abs) and
virescens. The heliomycin peptides are used as pharmaceuticals for treating or preventing fungal infections in humans and animals. They may also be used as antifungal agents for plant protection. Nucleic acid encoding the heliomycin peptides is used to generate transgenic plants that are resistant to some fungi and bacteria (specifically Cercospora beticola, Cladosporium herbarum, Fusarium culmorum, F. oxysporum and Phytophthora cinnamoni), and for recombinant

This is a randomised AB loop encoded by clone 8 (see V26502) of a large peptide library (2 million clones) of synthetic Pleckstrin homology (PH) domains with randomised discontinuous surface epitopes. The progenitor AB sequence comprises amino acid residues (16-21 of a stabilised synthetic PH domain (see W54310) of human (2 cytohesin 1. The peptide library was generated by randomisation of AB and CD loop regions using randomised obligonoutlectide primers (see W26493-94). The randomised AB and CD loop regions of 9 clones (see W54292-309) of the peptide library are provided. Randomisation the progenitor domain. The invention provides vectors that are used for the production of PH domain-like peptide libraries, which can be screened to identify peptides that have desirable properties, especially novel binding or catallytic properties, and which may be of use in research or therapy, or as vaccines. Novel synthetic protein structural templates for the generation, screening and evolution of functional molecular surfaces are provided.
                                                                                                                                                                                                                                                                                                                                                   Gaps
then reacting each of a panel of candidate mimotopes representative of a random set of 3D contours with the analyte-reacting Abs. A subject is immunised with one or more mimotopes identified and the product Abs are recovered from the serum of the subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Vectors used to produce PH domain-like peptide libraries - which screened for therapeutically useful peptide(s), e.g. to produce

The specification describes vaccines which comprise immunologically effective amounts of T cell receptor (TCR) peptides. The TCRs are present on the surface of T cells. The TCRs are chosen from W beta 6.73, V beta 6.74, V beta
                                                                                   Vaccine; T cell receptor; TCR; T cell; V beta 6.2/3; V beta 6/7; V beta 2; V beta 5/1; V beta 7; V beta 13; V beta 6; multiple sclerosis.
                                                    V beta 6 clone found in MS patients after vaccination with TCR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             TO cell receptor peptide-derived vaccines

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    W40264-W40275 are peptide fragments of an R-specific amidohydrolase isolated from Klebsiella oxytoca strain PRS1. This enzyme allows the microorganism to utilise 3,3,3-trifluoro-2-hydroxy-2-methyl propionamide as its sole nitrogen source. This amidohydrolase is used in a process for preparing (R)-isoforms of 3,3,3-trifluoro-2-hydroxy-2-methyl propionamide which is cheaper than prior art optical resolution of the racemate using dimethoxy strychnine or (S)-(-)- alpha -methylbenzylamine.
                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Tri:fluoro-2-hydroxy-2-methyl-propionic acid enantiomer preparation - by stereoselective hydrolysis of corresponding racemic amide using microorganism or derived enzyme, used as drug intermediate

Virus (REHV) DNA polymerase specific antigen. Primers used in the amplification of polymerase specific antigen. Primers used in the amplification of polymerase specific antigen. Primers used in the especially in the diagnosis of herpes viral infection. Herpes virus DNA polymerases of this invention, may be used in vaccines for the protection against infection by a herpes virus of the RFHV/KSHV family. They may also be used in the design and screening of anti-viral drugs. Antibodies raised against the polymerase or fragments of it, may be used in the detection of herpes virus infection and for drug targetting for the therapy of herpes virus infection and for drug targetting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequences given in R35090-100 and R34628-32 are peptides which were used to design the probes given in Q40219-34. These probes can be used to identify Bacillus thuringiansis (BH) DNA which encodes insecticidally active endotoxin. Probe (a) identifies genes encoding a toxin effective against any sort of insect. Sequences (b) and (e)-(l) are specific for toxins against lepidopters, sequences (c), (m) and (n) for toxins active against diptera and sequence (d), (o) and (p) for toxins active against coleoptera.
                                                           The present sequence represents a retroperitoneal fibromatosis herpes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Probe; Bacillus thuringiensis; Bt; insecticidal; active; endotoxin; lepidoptera; diptera; coleoptera.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gene probe for identifying endotoxin sequences in Bacillus thuringiensis - are universal, type specific or gene specific, for rapid detection and characterisation of insecticidal activity
  used in the detection and treatment of herpes virus infection
                                                                                                                                                                                                                                                                          Score 19; DB 18; Length 7;

                                                                                                                                                                                                                                                                                                                           R75669-R75678 and R75682 are streptokinase binding peptides derived from the human plasmin B chain in the regions 576-600, 620-640 or 640-655 amino acids. The peptides are also capable of binding other proteins useful particularly when immobilised on a solid support for use in affinity chromatography.

The sequence given is a complementarity determining region (CDR) designated CDR(f). CDR's are found in the variable domains of light and heavy chains which form the antigen binding site, and act as connectors between the four framework regions.

It has been noted that there seem to be no characteristic features which distinguish human from mouse or rat CDR's and they are therefore immunologically identical. The CDR described is used in a ligand with a binding affinity for the human CD3 antigen within the CDR's decribed in R23736 and R23737.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         IL-6; antagonist; cytokine; B cell differentiation; inflammation; tissue injury; B9.9 hybridoma cell line; Castleman's Disease; Lennart's T-cell lymphoma; Non-Hodgkin's lymphoma; allergy; immune deficiency disease; cardiac myxoma; mesangial proliferative glomerulonephritis.

The probes can be used for the detection of endotoxin producing B.t. microbes. The probes aid in the search for useful microbes hosting toxin encoding genes, specifically from dipteran species.

An aglycosylated IgG antibody having a binding affinity for the human CD3 antigen complex comprises at least one CDR selected from the amino acid sequences given in R50105-R50110. The heavy and light chain variable domains of an aglycosylated antibody is given in R41721-R41722. The antibodies are useful as immunosupressants. Unlike glycosylated antibodies, they do not induce T-cell mitogenesis nor do they cause high level release of cytokines.
preventing graft rejection and treating cancer, and does not induce \ensuremath{\mathtt{T}} cell proliferation and cytokine prodn.
                                                                                                                                                                                                               Score 19; DB 14; Length 9; Pred. No. 2.1e+05; 2; Mismatches 2; Indels

                                                                                                                                                                                                                          This peptide is a specific example of a highly generic claimed formula covering sequences derived from the p51-70 portion (i.e the IL-6 receptor-binding portion) of IL-6 (see R37216) or modelled after different portions of this sequence. In an assay to determine IL-6 antagonist activity of this peptide, proliferation of the IL-6 dependent B9.9 hybridoma cell line (J.Immunol. 139: 4116, 1987) was inhibited. See R37216-R37261.
